

ELMER'S CLEAN-UP TIPS

HOW CAN I REMOVE SCHOOL GLUE?

Surfaces: When concentrated in small areas, a clean cloth should be soaked in warm water and applied to the glue stain. Check the stain for softening after a couple hours. The softened glue should then be able to be wiped clean with a clean dry cloth. Repeat this procedure until all the glue has been removed.

Clothing: When dry, do not use hot water, dry cleaning solvents, a hot drum dryer or iron before the removal of the adhesive is complete, as they can fuse the adhesive film irreversibly, making removal impossible. Soaking in room temperature water for 24 hours or longer will help to redisperse or soften the film. After soaking, wash the fabric in a normal wash cycle and allow it to dry at room temperature. Check for discoloration and stiffness on drying. If so, repeat the process until the item is cleaned to your satisfaction.
